# Presentation for Polish BSD User Group Meetup

November 15th, 2018  
Warsaw, Poland

# About me:

**PABLO CARBONI (42), FROM BUENOS AIRES, ARGENTINA.**

*Worked as Unix Admin, DNS Admin, Net Admin, etc, the last 2 decades.*

*“Passionate” for DNS, FreeBSD, Network, RFC, and developer stuff related.*

You can reach me at:   

Twitter / Mastodon: **@pcarboni / @pcarboni@bsd.network**

LinkedIn: **[linkedin.com/in/pcarboni](https://www.linkedin.com/in/pcarboni)**

Disclaimer: This story has intentionally workplaces renamed, and sensitive info deleted.

# How does this story start?

Five years ago, at work, while taking KPIs from some DNS hardware appliances, I've detected a bottle-neck on CPU usage and queries per second... (HW upgrade was planned in the meantime).

The numbers? *60% CPU USAGE - 20 KQPS PER PHYSICAL BOX (40 KQPS TOTAL)* .

(In parallel, - just for "fun" -, I've started to test Unbound on lab environment, because some people gave me good comments).

*SO, PUT OUR HANDS ON THE KEYBOARD!*

# The tools (lab infrastructure, part #1/2)

- **Hardware:** Dell PowerEdge 1950 double Quadcore (2,0 Gigahertz)
- **OS:** FreeBSD 8.4 RELEASE/AMD64
- **DNS software:** Unbound 1.4.21 [*NLNet labs*], installed from ports directory -tree updated-, compiled with Libevent [*Niels Provos*].

Just in case, I've used Libevent 1.4.14b (proven stable)

- **Measurement tools:** dnstop, from *Measurement factory*.

# The tools (lab infrastructure, part #2/2)

- **Stressing tools:** dnsperf tool, in particular resperf (plus query file sample)  
[Nominum - Now Akamai]

## **Query files taken from:**

ftp://ftp.nominum.com/pub/nominum/dnsperf/data

- **A depth-in reading (essential, do not skip)** from the site:  
<https://calomel.org>

(Specially, *Unbound DNS tutorial* and *FreeBSD Network performance tuning*)

**Note:** The site is *highly recommended* for several common tasks like fine tuning services, and \*BSD OSes.

# The masterplan (The start, #1/2)

After FreeBSD was installed, one terminal was opened with dnstop. The other terminal was running resperf.

Why did I use dnstop?

- It's a powerful tool for debugging queries and gathering dns stats.
- **WHEN QUERIES QUANTITY WAS ALMOST THE SAME AS THE ANSWERS, IT SHOWS THAT MAXIMUM CAPACITY WAS NOT REACHED (YET).**
- It doesn't interfere with any DNS service.
- It's very lightweight, available for several OSes

# The masterplan (The start, #2/2)

Why did I use resperf? (Seems that current dnstperf was enhanced)

- It gave me the MAXIMUM QPS ALLOWED BY RANDOM QUERIES by simulating a cache resolver and increasing queries quantity
- At that time, it had better(objective) results vs dnstperf.

**Note that resperf is an interesting tool for simulating random queries from a with certain maximum desired.**

# Some sample screenshots (taken from elsewhere)

## Resperf report 20121229-1007

### Resperf output

DNS Resolution Performance Testing Tool  
Winnum Version 2.0.0.0

```
[Status] Command line: resperf -P 20121229-1007.gnuplot -i localhost -d queryfile.example-current -n 50  
[Status] Sending  
[Status] Waiting for more responses  
[Status] Testing complete
```

### Statistics:

```
Queries sent: 1500  
Queries completed: 1500  
Queries lost: 0  
Run time (s): 100.000000  
Maximum throughput: 50.000000 qps  
Lost at that point: 0.00%
```

### Plots

**RESPERF**

Queries: 452 new, 12463 total

Sources	Count	%	cum%
	2877	23.1	23.1
	803	6.4	29.5
	772	6.2	35.7
	675	5.4	41.1
	303	2.4	43.6
	138	1.1	44.7
	135	1.1	45.8
	119	1.0	46.7
	112	0.9	47.6
	102	0.8	48.4
	98	0.8	49.2

**DNSTOP**

# The masterplan (The end)

- First tests were promising. Without tuning, **I've got 10-15kqps**
- **By following Calomel's hints about Unbound and FreeBSD**, I've ended up by doing fine tuning on network card, OS (udp, sockets, ports range, etc), and Unbound config. (**However, no DNSSEC was used**)
- My dry (but real) tests were incredible: **I've got > 54kqps!**
- Yes, DNS service -with high load in mind- was under my control! :-)

# The deployment (The end of this story)

- It should be noted that a rapid deployment for this lab took place because of several factors (including dns performance).
- Final deployment lasted for 6 months; started from 80kqps, ending with 120kqps distributed on 3 physical servers.
- It's worth to note that the queries were made from subscribers to the internet.
- And yes, the result was incredible!

FreeBSD®
